Springer

Dear Author,

Here are the proofs of your article.

- You can submit your corrections **online**, via **e-mail** or by **fax**.
- For **online** submission please insert your corrections in the online correction form. Always indicate the line number to which the correction refers.
- You can also insert your corrections in the proof PDF and **email** the annotated PDF.
- For fax submission, please ensure that your corrections are clearly legible. Use a fine black pen and write the correction in the margin, not too close to the edge of the page.
- Remember to note the **journal title**, **article number**, and **your name** when sending your response via e-mail or fax.
- **Check** the metadata sheet to make sure that the header information, especially author names and the corresponding affiliations are correctly shown.
- **Check** the questions that may have arisen during copy editing and insert your answers/ corrections.
- **Check** that the text is complete and that all figures, tables and their legends are included. Also check the accuracy of special characters, equations, and electronic supplementary material if applicable. If necessary refer to the *Edited manuscript*.
- The publication of inaccurate data such as dosages and units can have serious consequences. Please take particular care that all such details are correct.
- Please **do not** make changes that involve only matters of style. We have generally introduced forms that follow the journal's style.
  Substantial changes in content, e.g., new results, corrected values, title and authorship are not allowed without the approval of the responsible editor. In such a case, please contact the Editorial Office and return his/her consent together with the proof.
- If we do not receive your corrections **within 48 hours**, we will send you a reminder.
- Your article will be published **Online First** approximately one week after receipt of your corrected proofs. This is the **official first publication** citable with the DOI. **Further changes are, therefore, not possible.**
- The **printed version** will follow in a forthcoming issue.

**Please note**

After online publication, subscribers (personal/institutional) to this journal will have access to the complete article via the DOI using the URL: http://dx.doi.org/[DOI].
If you would like to know when your article has been published online, take advantage of our free alert service. For registration and further information go to: http://www.springerlink.com.

Due to the electronic nature of the procedure, the manuscript and the original figures will only be returned to you on special request. When you return your corrections, please inform us if you would like to have these documents returned.

## 1 Introduction

Series expansions of fundamental solutions are essential to error and stability analysis of the method of fundamental solutions, and to algorithms and analysis of the null field method (NFM). For linear elastostatics, new Fourier series expansions of FS are derived, directly from integration. The new expansions of the FS are simpler than those in Chen et al. [5], thus facile to analysis of MFS [12–14] and to the NFM [16–18]. For elasticity problems, when the fundamental solutions (FS) or particular solutions (PS) satisfying PDE are chosen, the Trefftz method (TM) [19] leads to the method of fundamental solutions (MFS) and the method of particular method (MPS), respectively. The MFS and MPS can be applied to arbitrary domains. For circular domain with multiple holes, the null field method (NFM) is proposed by Chen with his research groups. In NFM, the fundamental solutions (FS) with the source nodes outside of the solution domain are used in the Green formulas. The Fourier expansions of the known and the unknown boundary conditions on the circular boundaries are chosen, so that the explicit algebraic equations are easily obtained by means of orthogonality of Fourier functions. Recently, the explicit linear algebraic equations of NFM are provided in [16–18], which are easy for real application. The NFM has been applied to elliptic and eigenvalue problems in circular domains with multiple holes, reported in many papers; here we cite Chen's work for Laplace's equation in [2,4], and for elastostatics problems in [3,5]. Extensions to elliptic boundaries can be found in Crouch and Mogilevskaya [8], and Chen et al. [6,7].

For the NFM of elastostatics problems, the expansions of the fundamental solutions (FS) are a must. Although the series expansions of FS for plane elastostatics and basic methods are first given in Chen et al. [5]. In this paper, new and simpler series expansions of the FS are derived directly via integration. On the other hand, for error analysis of the MFS, the expansions of FS are essential. Since the error bounds of harmonic polynomials as PS in TM have been established in [19], the errors between the FS and harmonic polynomials can be found, based on the series expansions of FS, see Li [12] for Laplace's equation. The stability analysis of MFS in [15] also needs the expansions of FS. By following the arguments in [12,15], we may also carry out the analysis for the MFS of linear elastostatics (see Li [14]), once the series expansions of FS are provided. Hence, the new series expansions of FS in this paper are *important to both theory and computation of linear elastostatics* [10,11,19–22].

This paper is organized as follows. In Sect. 2, basic mathematical description for linear elastostatics problems in 2D is provided, and their fundamental solutions (FS) are introduced. In Sect. 3, preliminary expansion formulas are given, and in Sects. 4 and 5 main integration formula are derived. In Sect. 6, new expansions of the FS of linear elastostatics in 2D are provided.

## 2 Linear elastostatics problems in 2D

### 2.1 Basic theory

Consider the linear elastostatics problem in 2D. Denote the displacement vector,

$$\vec{w} = \mathbf{w} = \{w_1(\mathbf{x}), w_2(\mathbf{x})\}^T = \{u(x, y), v(x, y)\}^T, \tag{2.1}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

where $\vec{x} = \mathbf{x} = (x_1, x_2) = (x, y)$. When there exists no body force $\vec{f} \equiv 0$, we obtain the homogeneous equation, called the Cauchy–Navier equation of linear elastostatics for isotropic body:

$$\mu \Delta \vec{w} + (\lambda + \mu)\nabla(\nabla \cdot \vec{w}) = 0 \quad \text{in } S, \tag{2.2}$$

where and $\lambda$ and $\mu$ are the Lamé constants. Eq. (2.2) can be written as

$$\Delta \vec{w} + \frac{1}{1-2\nu}\nabla(\nabla \cdot \vec{w}) = 0 \quad \text{in } S, \tag{2.3}$$

where the Poisson ratio

$$\nu = \frac{\lambda}{2(\lambda+\mu)}, \quad 0 < \nu < \frac{1}{2}. \tag{2.4}$$

We cite a theorem from Chen and Zhou [1].

**Theorem 2.1** *The general solutions of the linear elastostatic equations* (2.2) *in 3D and 2D are given by*

$$\vec{w}(\vec{x}) = \vec{h}(\vec{x}) - \kappa \nabla[\vec{x} \cdot \vec{h}(\vec{x}) + q(\vec{x})], \tag{2.5}$$

*where $\vec{h}(\vec{x})$ are the harmonic vector and $q(\vec{x})$ is a harmonic function, and the constant*

$$\kappa = \frac{1}{4(1-\nu)}. \tag{2.6}$$

## 2.2 Fundamental solutions

The principal fundamental solutions of linear Elastostatics in 2D are given in [1] as

$$E_2(\mathbf{x}, \xi) = \frac{\lambda + 3\mu}{4\pi\mu(\lambda+2\mu)}\left\{-\ln r_{\mathbf{x}\xi} I_2 + \frac{\lambda+\mu}{\lambda+3\mu}\frac{1}{r_{\mathbf{x}\xi}^2}[(\mathbf{x}-\xi)(\mathbf{x}-\xi)^T]\right\}, \tag{2.7}$$

where $r_{\mathbf{x}\xi} = |\mathbf{x} - \xi|$ and $I_2$ is the identity matrix. The FS in (2.7) satisfy

$$\mu \Delta E_2(\mathbf{x}, \xi) + (\lambda+\mu)\nabla_{\mathbf{x}}[\nabla_{\mathbf{x}} \cdot E_2(\mathbf{x}, \xi)] = -\delta(\mathbf{x} - \xi) I_2. \tag{2.8}$$

Choose the source nodes $Q(\xi_i, \eta_i)$ to be uniformly located on a larger circle of the 2D domain $S$, and denote the collocation points $P(x, y)$, where

$$x = \rho\cos\theta, \quad y = \rho\sin\theta, \tag{2.9}$$
$$\xi_i = R\cos\phi_i, \quad \eta_i = R\sin\phi_i, \quad i = 1, 2, \ldots, N,$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

where $R > \max_S \rho$, $\rho = \sqrt{x^2 + y^2}$, $R = \sqrt{\xi_i^2 + \eta_i^2}$ and $\phi_i = \frac{i2\pi}{N}$. Then

$$r_i = r_{\mathbf{x}\xi_\mathbf{i}} = \sqrt{R^2 + \rho^2 - 2R\rho\cos(\theta - \phi_i)}. \tag{2.10}$$

Denote $\vec{d}_i = (a_i, b_i)$ with the constants $a_i$ and $b_i$, and $\vec{u}_i = (u_i, v_i)^T$. We have

$$\vec{u}_i = E_2(\mathbf{x}, \xi_\mathbf{i})\vec{d}_i, \tag{2.11}$$

where

$$u_i = a_i\left(-A\ln r_i + B\frac{(x-\xi_i)^2}{r_i^2}\right) + b_i B\frac{(x-\xi_i)(y-\eta_i)}{r_i^2}, \tag{2.12}$$

$$v_i = a_i B\frac{(x-\xi_i)(y-\eta_j)}{r_i^2} + b_i\left(-A\ln r_i + B\frac{(y-\eta_i)^2}{r_i^2}\right), \tag{2.13}$$

and the constants

$$A = \frac{\lambda + 3\mu}{4\pi\mu(\lambda + 2\mu)}, \quad B = \frac{\lambda + \mu}{4\pi\mu(\lambda + 2\mu)}. \tag{2.14}$$

From Theorem 2.1, by adding the simple fundamental solutions $\nabla(\ln r) = \{\frac{x}{r^2}, \frac{y}{r^2}\}^T$, we obtain the general linear combination of fundamental solutions,

$$u_N = u_N(x, y) = \sum_{i=1}^{N}\left\{a_i\left(-\ln r_i + D\frac{(x-\xi_i)^2}{r_i^2}\right) + b_i D\frac{(x-\xi_i)(y-\eta_i)}{r_i^2} + c_i\frac{(x-\xi_i)}{r_i^2}\right\}, \tag{2.15}$$

$$v_N = v_N(x, y) = \sum_{i=1}^{N}\left\{a_i D\frac{(x-\xi_i)(y-\eta_i)}{r_i^2} + b_i\left(-\ln r_i + D\frac{(y-\eta_i)^2}{r_i^2}\right) + c_i\frac{(y-\eta_i)}{r_i^2}\right\}, \tag{2.16}$$

where $a_i$, $b_i$ and $c_i$ are the coefficients, the constant

$$D = \frac{B}{A} = \frac{\lambda + \mu}{\lambda + 3\mu} = \frac{1}{3 - 4\nu} = \frac{\kappa}{1 - \kappa}, \tag{2.17}$$

and $\kappa$ is given in (2.6). By using the FS in (2.15) and (2.16), and by employing the collocation Trefftz techniques in [19], the method of fundamental solutions (MFS)

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

are established. For Lapalce's equation, the error analysis of MFS in [14] is made, based on the expansions of FS (see Li [12]), and the stability analysis of MFS in [15] also needs the expansions of FS. Evidently, the expansions of FS are a basic tool in analysis of the MFS.

The principal FS in (2.7) is expressed in the matrix form

$$\begin{pmatrix} -\ln r(1-\kappa)+\kappa\frac{x^2}{r^2} & \kappa\frac{xy}{r^2} \\ \kappa\frac{xy}{r^2} & -\ln r(1-\kappa)+\kappa\frac{y^2}{r^2} \end{pmatrix}$$

$$= (1-\kappa)\begin{pmatrix} -\ln r+D\frac{x^2}{r^2} & D\frac{xy}{r^2} \\ D\frac{xy}{r^2} & -\ln r+D\frac{y^2}{r^2} \end{pmatrix}, \tag{2.18}$$

where $D$ is given in (2.17). We cite the Betti–Somigliana formula with the principal FS [1].

**Theorem 2.2** *There exist the Betti-Somigliana formulas for linear elastostatics:*

$$\vec{w}(\mathbf{x}) = \int_{\partial\Omega} \{E_2(\mathbf{x},\xi)\cdot\vec{\tau}(\vec{w}) - \vec{\tau}(E_2(\mathbf{x},\xi))\cdot\vec{w}\}d\sigma_\xi, \quad \mathbf{x}\in\Omega, \tag{2.19}$$

$$\frac{1}{2}\vec{w}(\mathbf{x}) = \int_{\partial\Omega} \{E_2(\mathbf{x},\xi)\cdot\vec{\tau}(\vec{w}) - \vec{\tau}(E_2(\mathbf{x},\xi))\cdot\vec{w}\}d\sigma_\xi, \quad \mathbf{x}\in\partial\Omega, \tag{2.20}$$

$$0 = \int_{\partial\Omega} \{E_2(\mathbf{x},\xi)\cdot\vec{\tau}(\vec{w}) - \vec{\tau}(E_2(\mathbf{x},\xi))\cdot\vec{w}\}d\sigma_\xi, \quad \mathbf{x}\in\bar{\Omega}^c, \tag{2.21}$$

*where $\Omega$ is an open area, and $\bar{\Omega}^c_\xi$ is the complementary region of the close area $\bar{\Omega}$ including the exterior and the interior boundaries $\partial S_R$ and $\partial S_{R_1}$.*

The boundary elements methods originated from (2.20) and (2.19), but the NFM is developed from (2.21) and (2.19), based on the expansions of FS (see [5]).

## 3 Preliminary formulas

Denote two nodes by $P(x,y)$ and $Q(\xi,\eta)$ with $x=\rho\cos\theta$, $y=\rho\sin\theta$, $\xi = R\cos\phi$, and $\eta = R\sin\phi$. Then $\rho=\sqrt{x^2+y^2}$, $R=\sqrt{\xi^2+\eta^2}$ and $r=|\overline{PQ}|=\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2}$. In this section, we give the basic integral expansions of $\ln r$ and $\frac{1}{r^2}$. First we obtain a lemma from [9,12].

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

**Lemma 3.1** *For $R > \rho$, there exist the equalities*

$$\frac{1}{2\pi}\int_0^{2\pi}(\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2})d\phi = \ln R,$$

$$\frac{1}{\pi}\int_0^{2\pi}(\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2})\cos m\phi d\phi = -\frac{\rho^m}{mR^m}\cos m\theta, \quad m=1,2,\ldots,$$

$$\frac{1}{\pi}\int_0^{2\pi}(\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2})\sin m\phi d\phi = -\frac{\rho^m}{mR^m}\sin m\theta, \quad m=1,2,\ldots$$

Based on the Fourier coefficients of $\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2}$ from Lemma 3.1, we have the following lemma immediately.

**Lemma 3.2** *There exist the expansions*

$$\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2} = \ln R - \sum_{n=1}^{\infty}\frac{1}{n}\left(\frac{\rho}{R}\right)^n\cos n(\theta-\phi), \quad \rho < R, \tag{3.1}$$

$$\ln\sqrt{\rho^2-2\rho R\cos(\theta-\phi)+R^2} = \ln \rho - \sum_{n=1}^{\infty}\frac{1}{n}\left(\frac{R}{\rho}\right)^n\cos n(\theta-\phi), \quad \rho > R. \tag{3.2}$$

Equations (3.1) and (3.2) are the expansions of the FS for Lapalce's equation in 2D used in [12, 15]. The rest of this paper is devoted to derive new expansions for $\kappa\nabla(\ln r) = \kappa\{\frac{x}{r^2}, \frac{y}{r^2}\}^T$ and (2.18) of linear Elastostatics in 2D. We give a new lemma.

**Lemma 3.3** *There exist the integrals,*

$$\int_0^{2\pi}\frac{\cos nx}{1+a^2-2a\cos x}dx = \frac{2\pi a^n}{1-a^2}(a^2<1) = \frac{2\pi a^{-n}}{a^2-1}(a^2>1), \tag{3.3}$$

$$\int_0^{2\pi}\frac{\sin nx}{1+a^2-2a\cos x}dx = 0. \tag{3.4}$$

*Proof* From Gradsheyan and Ryzhik, [9], p. 366

$$\int_0^{\pi}\frac{\cos nx}{1+a^2-2a\cos x}dx = \frac{\pi a^n}{1-a^2}(a^2<1) = \frac{\pi a^{-n}}{a^2-1}(a^2>1), \tag{3.5}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

we have

$$\int_0^{2\pi} \frac{\cos nx}{1+a^2-2a\cos x}dx = \int_{-\pi}^{\pi} \frac{\cos nx}{1+a^2-2a\cos x}dx$$

$$= \left(\int_{-\pi}^{0} + \int_0^{\pi}\right) \frac{\cos nx}{1+a^2-2a\cos x}dx. \quad (3.6)$$

Let $x=-t$ and $dx=-dt$. We have

$$\int_{-\pi}^{0} \frac{\cos nx}{1+a^2-2a\cos x}dx = -\int_{\pi}^{0} \frac{\cos nx}{1+a^2-2a\cos x}dx$$

$$= \int_0^{\pi} \frac{\cos nx}{1+a^2-2a\cos x}dx. \quad (3.7)$$

Combining (3.5)–(3.7) gives

$$\int_0^{2\pi} \frac{\cos nx}{1+a^2-2a\cos x}dx = 2\int_0^{\pi} \frac{\cos nx}{1+a^2-2a\cos x}dx$$

$$= \frac{2\pi a^n}{1-a^2}(a^2<1) = \frac{2\pi a^n}{a^2-1}(a^2>1). \quad (3.8)$$

This is the first desired result (3.3) with $a^2 < 1$. The proof for (3.3) with $a^2 > 1$ is similar.

Next we have

$$\int_0^{2\pi} \frac{\sin nx}{1+a^2-2a\cos x}dx = \left(\int_{-\pi}^{0} + \int_0^{\pi}\right) \frac{\sin nx}{1+a^2-2a\cos x}dx = 0, \quad (3.9)$$

since the following equality holds,

$$\int_{-\pi}^{0} \frac{\sin nx}{1+a^2-2a\cos x}dx = -\int_0^{\pi} \frac{\sin nx}{1+a^2-2a\cos x}dx = 0. \quad (3.10)$$

This is the second desired result (3.4), and completes the proof of Lemma 3.3.

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

**Lemma 3.4** *For $a^2 < 1$, there exist the Fourier expansions,*

$$\frac{1}{1+a^2-2a\cos x} = \frac{2}{1-a^2}\left(\frac{1}{2}+\sum_{n=1}^{\infty} a^n \cos nx\right). \tag{3.11}$$

*For $a^2 > 1$,*

$$\frac{1}{1+a^2-2a\cos x} = \frac{2}{a^2-1}\left(\frac{1}{2}+\sum_{n=1}^{\infty} a^{-n} \cos nx\right). \tag{3.12}$$

*Proof* Denote the Fourier series

$$\frac{1}{1+a^2-2a\cos x} = \frac{a_0}{2}+\sum_{k=1}^{\infty}(a_k \cos kx + b_k \sin kx), \tag{3.13}$$

where the Fourier coefficients $a_k$ and $b_k$ are obtained:

$$a_k = \frac{1}{\pi}\int_0^{2\pi} \frac{\cos kx}{1+a^2-2a\cos x}dx, \quad k = 0.1, 2, \ldots, \tag{3.14}$$

$$b_k = \frac{1}{\pi}\int_0^{2\pi} \frac{\sin kx}{1+a^2-2a\cos x}dx, \quad k = 1, 2, \ldots \tag{3.15}$$

Then from Lemma 3.3 we obtain for $a^2 < 1$

$$a_k = \frac{2}{\pi}\frac{\pi a^k}{1-a^2} = \frac{2a^k}{1-a^2}, \quad k = 0, 1, \ldots, \tag{3.16}$$

$$b_k = 0, \quad k = 1, 2, \ldots \tag{3.17}$$

Substituting the coefficients $a_k$ and $b_k$ into (3.13) gives the desired result (3.11) with $a^2 < 1$. Similarly, Eq. (3.12) with $a^2 > 1$ also holds. This completes the proof of Lemma 3.4.

**Theorem 3.1** *There exist the expansions*

$$\frac{1}{r^2} = \frac{2}{R^2-\rho^2}\left(\frac{1}{2}+\sum_{n=1}^{\infty}\left(\frac{\rho}{R}\right)^n \cos n(\phi-\theta)\right), \quad \rho < R, \tag{3.18}$$

$$\frac{1}{r^2} = \frac{2}{\rho^2-R^2}\left(\frac{1}{2}+\sum_{n=1}^{\infty}\left(\frac{R}{\rho}\right)^n \cos n(\phi-\theta)\right), \quad \rho > R, \tag{3.19}$$

*where $r^2 = R^2+\rho^2-2\rho R\cos(\phi-\theta)$, $\mathbf{x} = (x, y) = (\rho\cos\theta, \rho\sin\theta)$ and $\xi = (\xi, \eta) = (R\cos\phi, R\sin\phi)$.*

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 ☐ TYPESET ☐ DISK ☐ LE ☐ CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

*Proof* Since $r^2 = R^2(1 + a^2 - 2a\cos(\phi - \theta))$, we obtain (3.18) from Lemma 3.4 by noting $x = \phi - \theta$. Eq. (3.19) follows from (3.18) by the symmetry betwwen $\rho$ and $R$. This completes the proof of Theorem 3.1.

## 4 Expansions for $\frac{x-\xi}{r^2}$ and $\frac{y-\eta}{r^2}$

The simple FS for $q = \ln r$ is given from (2.5),

$$\nabla q = \left(\frac{x-\xi}{r^2}, \frac{y-\eta}{r^2}\right)^T = (T_1, T_2)^T. \tag{4.1}$$

To obtain the Fourier expansions of (4.1), we need the following lemma.

**Lemma 4.1** *Let $\rho < R$ and $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. There exist the integral formulas,*

$$\int_0^{2\pi} \frac{x-\xi}{r^2} d\phi = \int_0^{2\pi} \frac{y-\eta}{r^2} d\phi = 0, \tag{4.2}$$

$$\int_0^{2\pi} \frac{x-\xi}{r^2} \cos n\phi d\phi = -\frac{\pi}{R}\left(\frac{\rho}{R}\right)^{n-1} \cos(n-1)\theta, \tag{4.3}$$

$$\int_0^{2\pi} \frac{x-\xi}{r^2} \sin n\phi d\phi = -\frac{\pi}{R}\left(\frac{\rho}{R}\right)^{n-1} \sin(n-1)\theta, \tag{4.4}$$

$$\int_0^{2\pi} \frac{y-\eta}{r^2} \cos n\phi d\phi = \frac{\pi}{R}\left(\frac{\rho}{R}\right)^{n-1} \sin(n-1)\theta, \tag{4.5}$$

$$\int_0^{2\pi} \frac{y-\eta}{r^2} \sin n\phi d\phi = -\frac{\pi}{R}\left(\frac{\rho}{R}\right)^{n-1} \cos(n-1)\theta. \tag{4.6}$$

*Proof* Denote $a = \frac{\rho}{R}$. We have from Theorem 3.1 and the orthogonality of trigonometric functions,

$$\int_0^{2\pi} \frac{\rho\cos\theta - R\cos\phi}{r^2} d\phi = \rho\cos\theta \int_0^{2\pi} \frac{1}{\rho^2 + R^2 - 2\rho R\cos(\phi-\theta)} d\phi$$

$$-R\int_0^{2\pi} \frac{\cos\phi}{\rho^2 + R^2 - 2\rho R\cos(\phi-\theta)} d\phi$$

$$= \rho\cos\theta \frac{1}{R^2}\frac{2\pi}{1-a^2} - \frac{1}{R^2}\frac{2\pi}{1-a^2} Ra\cos\theta = 0. \tag{4.7}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

This is the left hand side of (4.2), and the proof for the right side of (4.2) is similar.

Next for (4.3), the integrand is given by

$$(x-\xi)\cos n\phi = (\rho\cos\theta - R\cos\phi)\cos n\phi$$
$$= \rho\cos\theta\cos n\phi - \frac{R}{2}(\cos(n-1)\phi + \cos(n+1)\phi). \quad (4.8)$$

From Theorem 3.1 and the orthogonality of trigonometric functions,

$$\int_0^{2\pi} \frac{x-\xi}{r^2}\cos n\phi d\phi = \frac{2\pi}{R^2(1-a^2)}\left\{\rho\cos\theta a^n\cos n\theta\right.$$
$$\left.-\frac{R}{2}(a^{n-1}\cos(n-1)\theta + a^{n+1}\cos(n+1)\theta)\right\}$$
$$= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho a^n}{2}(\cos(n-1)\theta + \cos(n+1)\theta)\right.$$
$$\left.-\frac{R}{2}(a^{n-1}\cos(n-1)\theta + a^{n+1}\cos(n+1)\theta)\right\}$$
$$= \frac{2\pi}{R^2(1-a^2)}a^{n-1}\left(\frac{\rho a}{2} - \frac{R}{2}\right)\cos(n-1)\theta. \quad (4.9)$$

Since

$$\frac{\rho a}{2} - \frac{R}{2} = \frac{\rho^2}{2R} - \frac{R}{2} = \frac{1}{2R}(\rho^2 - R^2) = \frac{R}{2}(a^2-1), \quad (4.10)$$

the desired result (4.3) follows from (4.9).

Third for (4.6), the integrand is

$$(y-\eta)\sin n\phi = (\rho\sin\theta - R\sin\phi)\sin n\phi$$
$$= \rho\sin\theta\sin n\phi - \frac{R}{2}(\cos(n-1)\phi - \cos(n+1)\phi). \quad (4.11)$$

Similarly, we have

$$\int_0^{2\pi} \frac{y-\eta}{r^2}\sin n\phi d\phi = \frac{2\pi}{R^2(1-a^2)}\left\{\rho\sin\theta a^n\sin n\theta\right.$$
$$\left.-\frac{R}{2}(a^{n-1}\cos(n-1)\theta - a^{n+1}\cos(n+1)\theta)\right\}$$
$$= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho a^n}{2}(\cos(n-1)\theta - \cos(n+1)\theta)\right.$$
$$\left.-\frac{R}{2}(a^{n-1}\cos(n-1)\theta - a^{n+1}\cos(n+1)\theta)\right\}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

$$= \frac{2\pi}{R^2(1-a^2)} a^{n-1} \left( \frac{\rho a}{2} - \frac{R}{2} \right) \cos(n-1)\theta$$

$$= -\frac{\pi}{R} a^{n-1} \cos(n-1)\theta. \tag{4.12}$$

This is the last result (4.6), and the proof for (4.4) and (4.5) is similar. This completes the proof of Lemma 4.1.

**Theorem 4.1** *Let* $\rho < R$ *and* $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. *There exist the expansions* [1],

$$T_1^i = \frac{x-\xi}{r^2} = -\frac{1}{R}\sum_{n=1}^{\infty}\left(\frac{\rho}{R}\right)^{n-1} (\cos(n-1)\theta\cos n\phi + \sin(n-1)\theta \sin n\phi)$$

$$= -\frac{1}{R}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^{n} \cos(n(\theta-\phi)-\phi), \tag{4.13}$$

$$T_2^i = \frac{y-\eta}{r^2} = \frac{1}{R}\sum_{n=1}^{\infty}\left(\frac{\rho}{R}\right)^{n-1} (\sin(n-1)\theta\cos n\phi - \cos(n-1)\theta \sin n\phi)$$

$$= \frac{1}{R}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^{n} \sin(n(\theta-\phi)-\phi). \tag{4.14}$$

*Proof* We have the Fourier expansion,

$$\frac{x-\xi}{r^2} = \frac{\alpha_0}{2} + \sum_{k=1}^{\infty}(\alpha_k \cos k\phi + \beta_k \sin k\phi), \tag{4.15}$$

where

$$\alpha_k = \frac{1}{\pi}\int_0^{2\pi} \frac{x-\xi}{r^2}\cos k\phi, \quad \beta_k = \frac{1}{\pi}\int_0^{2\pi} \frac{x-\xi}{r^2}\sin k\phi. \tag{4.16}$$

From Lemma 4.1, we obtain the first equality of (4.13). Let $n-1=k$ we have from (4.13)

$$\frac{x-\xi}{r^2} = -\frac{1}{R}\sum_{k=1}^{\infty}\left(\frac{\rho}{R}\right)^{k} (\cos k\theta\cos(k+1)\phi + \sin k\theta \sin(k+1)\phi)$$

$$= -\frac{1}{R}\sum_{k=0}^{\infty}\left(\frac{\rho}{R}\right)^{k} \cos(k(\theta-\phi)-\phi). \tag{4.17}$$

The proof for (4.14) is similar, and completes the proof of Theorem 4.1.

[1] The superscript "i" of $T_1^i$ denotes the case of $\rho < R$, and the superscript "e" in Theorem 6.3 denotes the case of $\rho > R$.

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

## 5 Expansions for $\frac{(x-\xi)^2}{r^2}$, $\frac{(y-\eta)^2}{r^2}$ and $\frac{(x-\xi)(y-\eta)}{r^2}$

For expansions of the principal FS, we need the following lemma.

**Lemma 5.1** *Let $\rho < R$, $a = \frac{\rho}{R}$ and $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. There exist the integral formulas*

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} d\phi = \int_0^{2\pi} \frac{(y-\eta)^2}{r^2} d\phi = \pi, \tag{5.1}$$

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2} d\phi = 0, \tag{5.2}$$

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \cos\phi d\phi = -\frac{\pi}{2} a\cos\theta, \tag{5.3}$$

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \sin\phi d\phi = \frac{\pi}{2} a\sin\theta, \tag{5.4}$$

$$\int_0^{2\pi} \frac{(y-\eta)^2}{r^2} \cos\phi d\phi = \frac{\pi}{2} a\cos\theta, \tag{5.5}$$

$$\int_0^{2\pi} \frac{(y-\eta)^2}{r^2} \sin\phi d\phi = -\frac{\pi}{2} a\sin\theta, \tag{5.6}$$

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2} \cos\phi d\phi = -\frac{\pi}{2} a\sin\theta, \tag{5.7}$$

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2} \sin\phi d\phi = -\frac{\pi}{2} a\cos\theta, \tag{5.8}$$

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \cos n\phi d\phi = \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2}\cos(n-2)\theta, \quad n \geq 2, \tag{5.9}$$

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \sin n\phi d\phi = \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2}\sin(n-2)\theta, \quad n \geq 2, \tag{5.10}$$

$$\int_0^{2\pi} \frac{(y-\eta)^2}{r^2} \cos n\phi d\phi = -\frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2}\cos(n-2)\theta, \quad n \geq 2, \tag{5.11}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

$$\int_0^{2\pi} \frac{(y-\eta)^2}{r^2} \sin n\phi d\phi = -\frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2} \sin(n-2)\theta, \quad n \geq 2, \quad (5.12)$$

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2} \cos n\phi d\phi = -\frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2} \sin(n-2)\theta, \quad n \geq 2, \quad (5.13)$$

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2} \sin n\phi d\phi = \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2} \cos(n-2)\theta, \quad n \geq 2. \quad (5.14)$$

*Proof* We only prove a few of them, since the proof of the others is similar. First, since

$$\begin{aligned}(x-\xi)^2 &= (\rho\cos\theta - R\cos\phi)^2 = \rho^2\cos^2\theta + R^2\cos^2\phi - 2\rho R\cos\theta\cos\phi \\ &= \rho^2\frac{1+\cos 2\theta}{2} + R^2\frac{1+\cos 2\phi}{2} - 2\rho R\cos\theta\cos\phi, \end{aligned} \quad (5.15)$$

we obtain the integral on the left side of (5.1):

$$\begin{aligned}\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} &= \frac{2\pi}{R^2(1-a^2)}\left\{\rho^2\frac{1+\cos 2\theta}{2} + R^2\frac{1+a^2\cos 2\theta}{2} - 2\rho R a\cos^2\theta\right\} \\ &= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{R^2+\rho^2}{2} - \rho^2\right\} = \pi. \end{aligned} \quad (5.16)$$

Below we will show (5.9)–(5.16) first, and (5.3)–(5.8) afterwards. For (5.9), the integrand is given from (5.15)

$$\begin{aligned}(x-\xi)^2\cos n\phi &= \rho^2\left(\frac{1+\cos 2\theta}{2}\right)\cos n\phi + R^2\left(\frac{1+\cos 2\phi}{2}\right)\cos n\phi \\ &\quad -2\rho R\cos\theta\cos\phi\cos n\phi \\ &= \frac{\rho^2+R^2}{2}\cos n\phi + \rho^2\left(\frac{\cos 2\theta}{2}\right)\cos n\phi + \frac{R^2}{4}[\cos(n+2)\phi \\ &\quad +\cos(n-2)\phi] - \rho R\cos\theta[\cos(n+1)\phi + \cos(n-1)\phi]. \end{aligned} \quad (5.17)$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

Then the left side integral in (5.9) gives

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \cos n\phi d\phi$$

$$= \frac{2\pi}{R^2(1-a^2)} \left\{ \frac{\rho^2+R^2}{2} a^n \cos n\theta + \rho^2 \left( \frac{\cos 2\theta}{2} \right) a^n \cos n\theta \right.$$

$$+ \frac{R^2}{4} [a^{n+2} \cos(n+2)\theta + a^{n-2} \cos(n-2)\theta]$$

$$\left. - \rho R \cos\theta [a^{n+1} \cos(n+1)\theta + a^{n-1} \cos(n-1)\theta] \right\}$$

$$= \frac{2\pi}{R^2(1-a^2)} \left\{ \frac{\rho^2+R^2}{2} a^n \cos n\theta + \frac{\rho^2}{4} a^n [\cos(n+2)\theta + \cos(n-2)\theta] \right.$$

$$+ \frac{R^2}{4} [a^{n+2} \cos(n+2)\theta + a^{n-2} \cos(n-2)\theta]$$

$$\left. - \frac{\rho R}{2} a^{n+1} [\cos(n+2)\theta + \cos n\theta] - \frac{\rho R}{2} a^{n-1} [\cos n\theta + \cos(n-2)\theta] \right\}. \quad (5.18)$$

In the above equations, the final coefficients in front of $\cos n\theta$ and $\cos(n+2)\theta$ are just zero. Hence we obtain

$$\int_0^{2\pi} \frac{(x-\xi)^2}{r^2} \cos n\phi d\phi = \frac{\pi a^{n-2}}{2R^2(1-a^2)} \left[ R^2 + \frac{\rho^4}{R^2} - 2\rho^2 \right] \cos(n-2)\theta. \quad (5.19)$$

There exists the equality,

$$R^2 + \frac{\rho^4}{R^2} - 2\rho^2 = R^2 - \rho^2 + \rho^2 \left( \frac{\rho^2}{R^2} - 1 \right)$$

$$= (R^2 - \rho^2) \left\{ 1 - \frac{\rho^2}{R^2} \right\} = R^2(1-a^2)^2. \quad (5.20)$$

Combining (5.19) and (5.20) gives the desired result (5.9).

Next for (5.11), there exist the equalities,

$$(y-\eta)^2 = (\rho \sin\theta - R \sin\phi)^2 = \rho^2 \sin^2\theta + R^2 \sin^2\phi - 2\rho R \sin\theta \sin\phi$$

$$= \rho^2 \frac{1-\cos 2\theta}{2} + R^2 \frac{1-\cos 2\phi}{2} - 2\rho R \sin\theta \sin\phi, \quad (5.21)$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

and

$$
\begin{aligned}
(y-\eta)^2\cos n\phi &= \frac{\rho^2+R^2}{2}\cos n\phi - \frac{\rho^2}{2}\cos 2\theta\cos n\phi \\
&\quad -\frac{R^2}{2}\cos 2\phi\cos n\phi - 2\rho R\sin\theta\sin\phi\cos n\phi \\
&= \frac{\rho^2+R^2}{2}\cos n\phi - \frac{\rho^2}{2}\cos 2\theta\cos n\phi \\
&\quad -\frac{R^2}{4}[\cos(n+2)\phi+\cos(n-2)\phi] \\
&\quad -\rho R\sin\theta[\sin(n+1)\phi-\sin(n-1)\phi]. \qquad (5.22)
\end{aligned}
$$

Hence we have

$$
\begin{aligned}
\int_0^{2\pi}\frac{(y-\eta)^2}{r^2}\cos n\phi &= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho^2+R^2}{2}a^n\cos n\theta - \frac{\rho^2}{2}\cos 2\theta a^n\cos n\theta\right. \\
&\quad -\frac{R^2}{4}[a^{n+2}\cos(n+2)\theta + a^{n-2}\cos(n-2)\theta] \\
&\quad \left.-\rho R\sin\theta[a^{n+1}\sin(n+1)\theta - a^{n-1}\sin(n-1)\theta]\right\} \\
&= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho^2+R^2}{2}a^n\cos n\theta - \frac{\rho^2}{4}a^n[\cos(n+2)\theta\right. \\
&\quad +\cos(n-2)\theta] - \frac{R^2}{4}[a^{n+2}\cos(n+2)\theta + a^{n-2}\cos(n-2)\theta] \\
&\quad -\frac{\rho R}{2}[a^{n+1}(\cos n\theta - \cos(n+2)\theta) - a^{n-1}(\cos(n-2)\theta \\
&\quad \left.-\cos n\theta)]\right\} \\
&= -\frac{\pi}{2(R^2 1-a^2)}a^{n-2}\left(R^2+\frac{\rho^4}{R^2}-2\rho^2\right)\cos(n-2)\theta \\
&= -\frac{\pi}{2}(1-a^2)a^{n-2}\cos(n-2)\theta, \qquad (5.23)
\end{aligned}
$$

where we have used (5.20). This is the desired result (5.11).

Moreover for (5.14), we have

$$
\begin{aligned}
(x-\xi)(y-\eta) &= (\rho\cos\theta - R\cos\phi)(\rho\sin\theta - R\sin\phi) \\
&= \rho^2\cos\theta\sin\theta + R^2\cos\phi\sin\phi - \rho R[\cos\theta\sin\phi+\sin\theta\cos\phi] \\
&= \frac{\rho^2}{2}\sin 2\theta + \frac{R^2}{2}\sin 2\phi - \rho R[\cos\theta\sin\phi+\sin\theta\cos\phi],
\end{aligned}
$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

and

$$(x-\xi)(y-\eta)\sin n\phi = \frac{\rho^2}{2}\sin 2\theta \sin n\phi + \frac{R^2}{2}\sin 2\phi \sin n\phi$$
$$-\rho R[\cos\theta\sin\phi + \sin\theta\cos\phi]\sin n\phi$$
$$= \frac{\rho^2}{2}\sin 2\theta \sin n\phi + \frac{R^2}{4}[-\cos(n+2)\phi + \cos(n-2)\phi]$$
$$-\frac{\rho R}{2}[\cos\theta(-\cos(n+1)\phi + \cos(n-1)\phi)$$
$$+\sin\theta(\sin(n+1)\phi + \sin(n-1)\phi)].$$

Then we have

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2}\sin n\phi = \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho^2}{2}\sin n\theta a^n \sin 2\theta\right.$$
$$+\frac{R^2}{4}[-a^{n+2}\cos(n+2)\theta + a^{n-2}\cos(n-2)\theta]$$
$$-\frac{\rho R}{2}[\cos\theta(-a^{n+1}\cos(n+1)\theta + a^{n-1}\cos(n-1)\theta)$$
$$\left.+\sin\theta(a^{n+1}\sin(n+1)\theta + a^{n-1}\sin(n-1)\theta)]\right\}$$
$$= \frac{2\pi}{R^2(1-a^2)}\left\{\frac{\rho^2}{4}a^n[-\cos(n+2)\theta + \cos(n-2)\theta]\right.$$
$$+\frac{R^2}{4}[-a^{n+2}\cos(n+2)\theta + a^{n-2}\cos(n-2)\theta]$$
$$-\frac{\rho R}{4}\left\{-a^{n+1}[\cos(n+2)\theta + \cos n\theta] + a^{n-1}[\cos n\theta + \cos(n-2)\theta]\right.$$
$$\left.\left.+a^{n+1}[-\cos(n+2)\theta + \cos n\theta] + a^{n-1}[-\cos n\theta + \cos(n-2)]\right\}\right\}$$
$$= \frac{\pi}{2R^2(1-a^2)}\left(R^2 + \frac{\rho^4}{R^2} - 2\rho^2\right)\left(\frac{\rho}{R}\right)^{n-2}\cos(n-2)\theta$$
$$= \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{n-2}\cos(n-2)\theta. \tag{5.24}$$

This is the desired result (5.14).

Last, we show (5.3)–(5.8). Although we may follow the above approaches to derive integrals directly, we will solicit different arguments by means of a remedy for (5.9)–(5.14) with $n=1$. First we have from (5.9) with $n=1$

$$\widehat{\int_0^{2\pi}} \frac{(x-\xi)^2}{r^2}\cos\phi d\phi = \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{-1}\cos(-\theta). \tag{5.25}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

Let us scrutinize its derivation in (5.18). Note that in the expansions (3.18), there exist no negative powers as $\left(\frac{\rho}{R}\right)^{-1}$. In the last but one line in (5.18), we have found an improper term

$$\frac{2\pi}{R^2(1-a^2)}\frac{R^2a^{-1}}{4}\cos\theta = \frac{\pi}{1-a^2}\frac{a^{-1}}{2}\cos\theta, \tag{5.26}$$

which should be replaced by the correct term

$$\frac{\pi}{1-a^2}\frac{a}{2}\cos\theta. \tag{5.27}$$

Therefore, we find the error in (5.18) and so in (5.25) with $n = 1$

$$\begin{aligned} E_1 &= \frac{\pi}{1-a^2}\frac{a}{2}\cos\theta - \frac{\pi}{1-a^2}\frac{a^{-1}}{2}\cos\theta \\ &= \frac{\pi}{2}\frac{1}{1-a^2}(a-a^{-1})\cos\theta = \frac{\pi}{2}\frac{1}{1-a^2}a^{-1}(a^2-1)\cos\theta \\ &= -\frac{\pi}{2}a^{-1}\cos\theta. \end{aligned} \tag{5.28}$$

By removing this error, the true integral is obtained from (5.25) and (5.28)

$$\begin{aligned} \int_0^{2\pi}\frac{(x-\xi)^2}{r^2}\cos\phi d\phi &= \widehat{\int_0^{2\pi}}\frac{(x-\xi)^2}{r^2}\cos\phi d\phi + E_1 \\ &= \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{-1}\cos\theta - \frac{\pi}{2}a^{-1}\cos\theta \\ &= -\frac{\pi}{2}a\cos\theta. \end{aligned} \tag{5.29}$$

This is the desired result (5.3).

Finally, we show (5.8). From (5.14) with $n = 1$, we have

$$\widehat{\int_0^{2\pi}}\frac{(x-\xi)(y-\eta)}{r^2}\sin n\phi d\phi = \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{-1}\cos\theta. \tag{5.30}$$

In its derivation (5.24) with $n = 1$, there also exists the error

$$E_2 = \frac{\pi}{2}\frac{1}{1-a^2}(-a^{-1}+a)\cos\theta = -\frac{\pi}{2}a^{-1}\cos\theta. \tag{5.31}$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 TYPESET DISK LE CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

By removing this error we have the true integral

$$\int_0^{2\pi} \frac{(x-\xi)(y-\eta)}{r^2}\sin n\phi d\phi = \widehat{\int_0^{2\pi}} \frac{(x-\xi)(y-\eta)}{r^2}\sin n\phi d\phi + E_2$$
$$= \frac{\pi}{2}(1-a^2)\left(\frac{\rho}{R}\right)^{-1}\cos\theta - \frac{\pi}{2}a^{-1}\cos\theta$$
$$= -\frac{\pi}{2}a\cos\theta. \tag{5.32}$$

This is the desired result (5.8). The proof of other formulas is similar, and this completes the proof of Lemma 5.1.

Note that for the integration computation of Fourier functions by means of orthogonality, we should also derive those formulas with $n = 2$ due to $\cos(n-2)\phi = 1$. However, since in (3.18), the constant is just $\frac{1}{2}$, fortunately, the final integral values in (5.18) are exactly the same, so that we do not need extra-evaluation of (5.9). For the same reason, we do not need an extra-evaluation for the expansions (4.17).

From Lemma 5.1 we have the Fourier expansions immediately.

**Theorem 5.1** *Let* $\rho < R$, $a = \frac{\rho}{R}$ *and* $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. *There exist the expansions,*

$$\frac{(x-\xi)^2}{r^2} = \frac{1}{2} - \frac{a}{2}\cos(\theta+\phi) + \frac{1-a^2}{2}\sum_{n=2}^{\infty}\left(\frac{\rho}{R}\right)^{n-2}$$
$$\times(\cos(n-2)\theta\cos n\phi + \sin(n-2)\theta\sin n\phi)$$
$$= \frac{1}{2} - \frac{a}{2}\cos(\theta+\phi) + \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^{n}\cos(n(\theta-\phi)-2\phi),$$
$$\frac{(y-\eta)^2}{r^2} = \frac{1}{2} + \frac{a}{2}\cos(\theta+\phi)$$
$$-\frac{1-a^2}{2}\sum_{n=2}^{\infty}\left(\frac{\rho}{R}\right)^{n-2}(\cos(n-2)\theta\cos n\phi + \sin(n-2)\theta\sin n\phi)$$
$$= \frac{1}{2} + \frac{a}{2}\cos(\theta+\phi) - \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^{n}\cos(n(\theta-\phi)-2\phi),$$
$$\frac{(x-\xi)(y-\eta)}{r^2} = -\frac{a}{2}\sin(\theta+\phi) + \frac{1-a^2}{2}\sum_{n=2}^{\infty}\left(\frac{\rho}{R}\right)^{n-2}$$
$$\times(-\sin(n-2)\theta\cos n\phi + \cos(n-2)\theta\sin n\phi)$$
$$= -\frac{a}{2}\sin(\theta+\phi) - \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^{n}\sin(n(\theta-\phi)-2\phi).$$

## 6 The expansions of FS

Based on Sects. 4 and 5, we provide new expansions of the FS for linear elastostatics in 2D. For the simple FS with $\rho < R$ we have their expansions from Theorem 4.1.

**Theorem 6.1** *Let $\rho < R$ and $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. There exist the expansions of the simple FS,*

$$\kappa \begin{pmatrix} \frac{x-\xi}{r^2} \\ \frac{y-\eta}{r^2} \end{pmatrix} = \frac{\kappa}{R} \sum_{n=0}^{\infty} \left(\frac{\rho}{R}\right)^n \begin{pmatrix} -\cos(n(\theta - \phi) - \phi) \\ \sin(n(\theta - \phi) - \phi) \end{pmatrix}.$$

Next for the principal FS with $\rho < R$, we have their expansions from Theorem 5.1.

**Theorem 6.2** *Let $\rho < R$, $a = \frac{\rho}{R}$ and $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. There exist the expansions of the principal FS,*

$$E_2^i(\mathbf{x} - \xi) = \begin{pmatrix} T_{11}^i & T_{12}^i \\ T_{12}^i & T_{22}^i \end{pmatrix},$$

*where the entries*

$$T_{11}^i = (1-\kappa)\left\{-\left[\ln R - \sum_{n=1}^{\infty} \frac{1}{n}\left(\frac{\rho}{R}\right)^n \cos n(\theta - \phi)\right]\right.$$
$$\left. + D\left[\frac{1}{2} - \frac{a}{2}\cos(\theta + \phi) + \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^n \cos(n(\theta - \phi) - 2\phi)\right]\right\},$$
$$T_{22}^i = (1-\kappa)\left\{-\left[\ln R - \sum_{n=1}^{\infty} \frac{1}{n}\left(\frac{\rho}{R}\right)^n \cos n(\theta - \phi)\right]\right.$$
$$\left. + D\left[\frac{1}{2} + \frac{a}{2}\cos(\theta + \phi) - \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^n \cos(n(\theta - \phi) - 2\phi)\right]\right\},$$
$$T_{12}^i = (1-\kappa)D\left[-\frac{a}{2}\sin(\theta + \phi) - \frac{1-a^2}{2}\sum_{n=0}^{\infty}\left(\frac{\rho}{R}\right)^n \sin(n(\theta - \phi) - 2\phi)\right].$$

In the NFM, we do need the Fourier expansions for both $\rho > R$ and $\rho < R$. We have the following theorem.

**Theorem 6.3** *Let $\rho > R$ and $r^2 = R^2 + \rho^2 - 2\rho R\cos(\phi - \theta)$. There exist the expansions of the simple FS,*

$$\kappa \begin{pmatrix} \frac{x-\xi}{r^2} \\ \frac{y-\eta}{r^2} \end{pmatrix} = \frac{\kappa}{\rho} \sum_{n=0}^{\infty} \left(\frac{R}{\rho}\right)^n \begin{pmatrix} \cos(n(\phi - \theta) - \theta) \\ -\sin(n(\phi - \theta) - \theta) \end{pmatrix}. \quad (6.1)$$

Journal: 607 Article No.: 0137 MS Code: COMP-D-10-00071.1 ☐ TYPESET ☐ DISK ☐ LE ☐ CP Disp.:2010/11/10 Pages: 21 Layout: Small-X

*Proof* We will use Theorem 6.1 via symmetry. When $\rho > R$, we have

$$\frac{x-\xi}{r^2} = \frac{\rho\cos\theta - R\cos\phi}{R^2+\rho^2-2\rho R\cos(\phi-\theta)} = -\frac{R\cos\phi-\rho\cos\theta}{R^2+\rho^2-2\rho R\cos(\theta-\phi)}. \quad (6.2)$$

If switching $(\rho, \theta)$ and $(R, \phi)$, from Theorem 6.1 and (6.2), we obtain the first component of the vector in (6.1):

$$\kappa\frac{x-\xi}{r^2} = \frac{\kappa}{\rho}\sum_{n=0}^{\infty}\left(\frac{R}{\rho}\right)^n \cos(n(\phi-\theta)-\theta). \quad (6.3)$$

The proof for the second component of the vector in (6.1) is similar, and this completes the proof of Theorem 6.3.

Similarly, we have the following expansions from Theorem 6.2 via the symmetry.

**Theorem 6.4** *Let $\rho > R$, $a = \frac{\rho}{R}$ and $r^2 = R^2+\rho^2-2\rho R\cos(\phi-\theta)$. There exist the exapansions of the principal FS,*

$$E_2^e(\mathbf{x}-\xi) = \begin{pmatrix} T_{11}^e & T_{12}^e \\ T_{12}^e & T_{22}^e \end{pmatrix},$$

*where the entries are given by*

$$T_{11}^e = (1-\kappa)\left\{-\left[\ln\rho - \sum_{n=1}^{\infty}\frac{1}{n}\left(\frac{R}{\rho}\right)^n \cos n(\theta-\phi)\right]\right.$$
$$\left. + D\left[\frac{1}{2} - \frac{a^{-1}}{2}\cos(\theta+\phi) + \frac{1-a^{-2}}{2}\sum_{n=0}^{\infty}\left(\frac{R}{\rho}\right)^n \cos(n(\phi-\theta)-2\theta)\right]\right\},$$
$$T_{22}^e = (1-\kappa)\left\{-\left[\ln\rho - \sum_{n=1}^{\infty}\frac{1}{n}\left(\frac{R}{\rho}\right)^n \cos n(\theta-\phi)\right]\right.$$
$$\left. + D\left[\frac{1}{2} + \frac{a^{-1}}{2}\cos(\theta+\phi) - \frac{1-a^{-2}}{2}\sum_{n=0}^{\infty}\left(\frac{R}{\rho}\right)^n \cos(n(\phi-\theta)-2\theta)\right]\right\},$$
$$T_{12}^e = (1-\kappa)D\left[-\frac{a^{-1}}{2}\sin(\theta+\phi) - \frac{1-a^{-2}}{2}\sum_{n=0}^{\infty}\left(\frac{R}{\rho}\right)^n \sin(n(\phi-\theta)-2\theta)\right].$$

All series expansions in this paper have been verified by computation.

*Remark 6.1* The principal FS is more important than the simple FS, because from our numerical experiments, we may not need the simple FS (see [13]). By series operations, some expansions for $\frac{(x-\xi)^2}{r^2}$, $\frac{(y-\eta)^2}{r^2}$ and $\frac{(x-\xi)(y-\eta)}{r^2}$ are given in Chen et al. [5], which are more complicated than those in Theorem 5.1. The simplicity of expansions of FS in this paper is imperative to real application of linear elastostatics, such as error and stability analysis of MFS in [14,15], and algorithms and analysis of the NFM in [17].
